

In the Claims:

1     1.     (currently amended) A method for evaluating measuring  
2           signals of an electromagnetic field which is in interaction  
3           with an electrically conductive fluid for detecting  
4           components in the fluid which differ with respect to the  
5           electric conductivity of the fluid, characterized in that  
6           the measuring signals are divided into at least two  
7           channels and are evaluated in order to detect different  
8           distributions and concentrations in the ~~fluid.~~ fluid,  
9           characterized in that the electromagnetic field is  
10          generated by at least one transmitter coil flowed through  
11          by an alternating current, the fluid is a flowing metallic  
12          melt and is penetrated at least partly by the field at a  
13          measuring point flowed through by the melt and entrained  
14          non-metallic components are detected at the measuring point  
15          by means of disturbances in the field, with non-metallic  
16          components which are entrained in a contiguous fashion in  
17          a manner expanded in a direction of flow of the melt being  
18          detected in the melt on the basis of disturbances in the  
19          electromagnetic field in a first channel above a lower  
20          cut-off frequency  $f_{gu}$  and simultaneously components  
21          distributed discretely in the melt being detected in the  
22          melt in a second channel above an upper cut-off  
23          frequency  $f_{go}$ .

Claim 2 (canceled).

1 3. (currently amended) The method as claimed in claim ~~[[27]]~~  
2 1, characterized in that the flowing metallic melt is a  
3 steel melt flowing from a metallurgical vessel and the  
4 non-metallic components are slag and/or gases.

1 4. (currently amended) The method as claimed in claim ~~[[27]]~~  
2 1, characterized in that a product of the upper cut-off  
3 frequency  $f_{\text{go}}$  and ~~[[the]]~~ a flow speed  $v$  of the flowing  
4 metallic melt is ~~between from~~ 0.1 m/s<sup>2</sup> to 10 m/s<sup>2</sup> at the  
5 measuring point.

1 5. (currently amended) The method as claimed in claim ~~[[27]]~~  
2 1, characterized in that a product of the lower cut-off  
3 frequency  $f_{\text{gu}}$  and ~~[[the]]~~ a flow speed  $v$  of the flowing  
4 metallic melt is ~~between from~~ 0.001 m/s<sup>2</sup> to 0.01 m/s<sup>2</sup> at the  
5 measuring point.

1 6. (currently amended) The method as claimed in claim 1,  
2 characterized in that ~~a disturbance of the disturbances in~~  
3 the electromagnetic field generated by ~~[[a]]~~ the at least  
4 one transmitter coil ~~[[is]]~~ are detected on the basis of  
5 ~~a disturbance~~ disturbances of the voltage induced in a  
6 receiver coil.

1 7. (original) An apparatus for detecting non-metallic  
2 components in a flowing metallic melt with at least one  
3 transmitter coil which is flowed through by an alternating  
4 current for generating an electromagnetic field which

penetrates the flowing melt at least partly, a measuring element for measuring disturbances of the field at a measuring point which is flowed through by the melt and with an evaluating device, characterized by a first filter element which guides the disturbances of the electromagnetic field above a lower cut-off frequency  $f_{\text{eu}}$  into a first channel with which non-metallic components can be detected which are entrained by the melt and are expanded especially in the direction of flow, and by a second filter element which guides the disturbances of the electromagnetic field above an upper cut-off frequency  $f_{\text{eo}}$  into a second channel with which components can be detected which are distributed in the melt and are entrained in a discrete manner.

8. (original) The apparatus as claimed in claim 7, characterized by a summing element in at least one channel, in which the measured values detected in the channel are summed up into a summary value and by an amplitude filter which triggers a signal when the summary value exceeds a limit amplitude.

9. (original) The apparatus as claimed in claim 7, characterized in that the product of upper cut-off frequency  $f_{\text{eo}}$  and a flow speed  $v$  is between  $0.1 \text{ m/s}^2$  to  $10 \text{ m/s}^2$  at the measuring point.

1 10. (original) The apparatus as claimed in claim 7,  
2 characterized in that the product of lower cut-off  
3 frequency  $f_{cu}$  and the flow speed  $v$  is between  $0.001 \text{ m/s}^2$  to  
4  $0.01 \text{ m/s}^2$  at the measuring point.

1 11. (original) The apparatus as claimed in claim 7,  
2 characterized in that a measuring element is a receiver  
3 coil and that disturbances of the electromagnetic field at  
4 a measuring point can be detected on the basis of  
5 disturbances of the voltage induced in the receiver coil.

1 12. (original) The apparatus as claimed in claim 7,  
2 characterized in that the transmitter coil can also be  
3 flowed through by the melt.

1 13. (original) The apparatus as claimed in claim 7,  
2 characterized in that the transmitter coil is  
3 simultaneously the measuring element.

1 14. (original) The apparatus as claimed in claim 11,  
2 characterized in that the transmitter and/or receiver coil  
3 are each individually arranged in a metallic housing which  
4 is at least partly non-ferromagnetic.

1 15. (original) The apparatus as claimed in claim 11,  
2 characterized in that the transmitter and receiver coils  
3 are arranged in a common metallic housing which is at least  
4 partly non-ferromagnetic.

1    **16.** (original) The apparatus as claimed in claim 11,  
2       characterized in that the transmitter and receiver coil are  
3       axially spaced from each other and are separated from each  
4       other by a metallic wall and either both coils are arranged  
5       in a common housing or each coil is housed in a separate  
6       housing, with the housing(s) consisting of a metallic  
7       material and the metallic material being non-ferromagnetic  
8       at least in sections.

1    **17.** (original) The apparatus as claimed in claim 11,  
2       characterized in that the transmitter and receiver coils  
3       are integrated in at least one section of the pouring  
4       channel of a metallurgical vessel.

1    **18.** (original) A method of using the apparatus as claimed in  
2       claim 7, for initiating a warning signal and/or a control  
3       signal for triggering a flow control device and/or a device  
4       for modifying the flow of the metallic melt when detecting  
5       discrete and/or contiguous impurities.
